

Photonic Horizons™

The *Photonic Horizons*™ grant program is a photonics focused crowd sourcing and open innovation R&D funding initiative. The program serves as the framework for our clients to bring in ideas and facilitate innovation

The program consists of two-stages:
Phase I \$10k Proof of Concept
Phase II \$100k Functional Prototype

The entire program's timing, intellectual property framework and unique "dual-view" technical and business peer-review process are all specifically designed to facilitate collaboration and successful technology transfer to our clients

Your partner in
photonics-enabled
product development.

Illuminated Product Development

Open Photonics Inc. (OPI) helps its clients develop and commercialize new products. Photonics is one of the major enabling technologies of the 21st century and is often not among the core competencies of companies. We have this core expertise and leverage our Open Innovation development model to connect you with experts in the field of photonics capable of solving your problems. Through these activities, you deliver *your* product to *your* market quickly and efficiently.

What We Do

Product Development

Our clients have the market understanding and sales channel infrastructure to complement our network of commercial and innovation partners.

Outsourced Development

Most of our clients are interested in internalizing the development of photonic enabled technology, but often don't have a complete team. Open Photonics will develop a proof of concept then deliver working prototypes for management and market validation.

New Venture Formation

When requested, Open Photonics enters into joint ventures and partnerships to develop and produce new products within a new closely held entity. We will work closely with you to set up the venture, develop and productize the technology and bring the product to market.

Let Open Photonics be your trusted development partner, and use our expertise to deliver your light enabled products.

Tech Scouting

Optics and photonics is a vibrant and diverse field of science that requires extensive resources and expertise to thoroughly understand. Open Photonics offers a technology scouting service that allows our clients access to an insightful perspective on specific technology areas of interest. We leverage our expertise in the field, experiences in commercialization, and advisory boards to deliver technology scouting reports that capture the breadth of solutions and concise recommendations.

OPI technology scouting reports are often the first way we engage companies who are new to the concepts of outsourced development or Open Innovation.

Market Intelligence

When no market reports currently cover your target, or the market is too young to attract accessible reporting, OPI can give you the edge necessary to make informed product development and marketing decisions.

Whether introducing a new product or rebranding an existing one, OPI will deliver analysis of the competitive landscape and application spaces most appropriate to direct your subsequent marketing plan.
